

Project Initialization and Planning Phase

Date	12 July 2026
Team ID	SWTID-2026-7566
Project Title	Credit Card Approval Prediction
Maximum Marks	5 Marks

Project Proposal (Proposed Solution) report

The proposed solution is a Machine Learning-powered Credit Card Approval Prediction system that helps banks and applicants make faster, data-driven decisions. It analyzes applicant details such as income, credit history, employment status, and existing debts to predict whether a credit card application will be approved or rejected, along with the key factors influencing that decision.

Project Overview	
Objective	Develop an ML-powered system that predicts credit card approval or rejection based on applicant financial and personal data, enabling faster and more transparent decisions.
Scope	The system collects applicant details (income, credit history, employment, existing debts), preprocesses the data, trains a classification model, and provides real-time approval predictions along with the key factors influencing the decision.
Problem Statement	
Description	Many applicants face uncertainty and delays when applying for a credit card due to manual, inconsistent evaluation processes and a lack of clarity on why applications are approved or rejected.
Proposed Solution	
Description	An ML classification model trained on historical applicant data (income, credit score, employment, debts) that predicts approval/rejection instantly and highlights the key
